

# TRACE documents for good modelling practice

Volker Grimm

# ZEE QUESTION: IS THE MODEL GOOD ENOUGH?

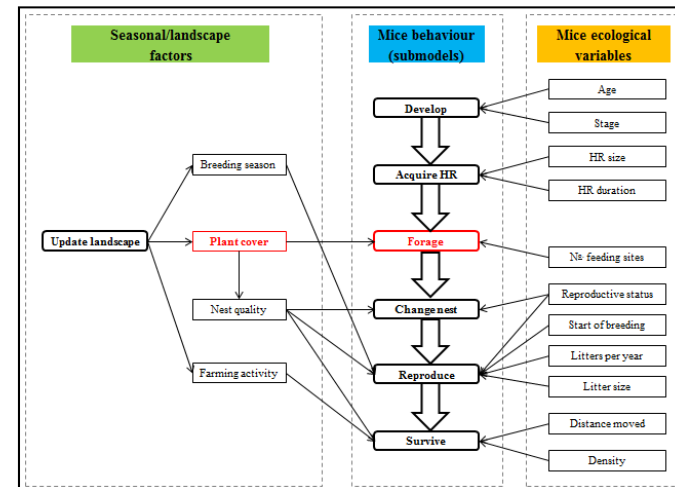

Model 1

[http://rotundschwarz-kd.blogspot.de/2010\\_05\\_01\\_archive.html](http://rotundschwarz-kd.blogspot.de/2010_05_01_archive.html)

Model 2

# GOOD MODELLING PRACTICE

## Do the right thing:

- **Communicate the model**
- **Justify underlying simplifying assumptions**
- **Document sources of biological information**
- **Document tests and understanding**
- **Provide evidence that model is realistic enough**
- **Communicate sensitivity and uncertainty**
- **Make predictions that are relevant for risk assessment**

## Review by Schmolke et al. (2010)

- Elements of Good Modelling Practice **are all there** and well-known, in principle, and not too controversial
- Very good attempts to provide guidance already exist (EPA; also in hydrological modelling)

### **THE REAL PROBLEM IS**

- **NOT** so much defining (guidance for) Good Modelling Practice

**BUT** getting this practice – into practice

# BASIC IDEA OF TRACE

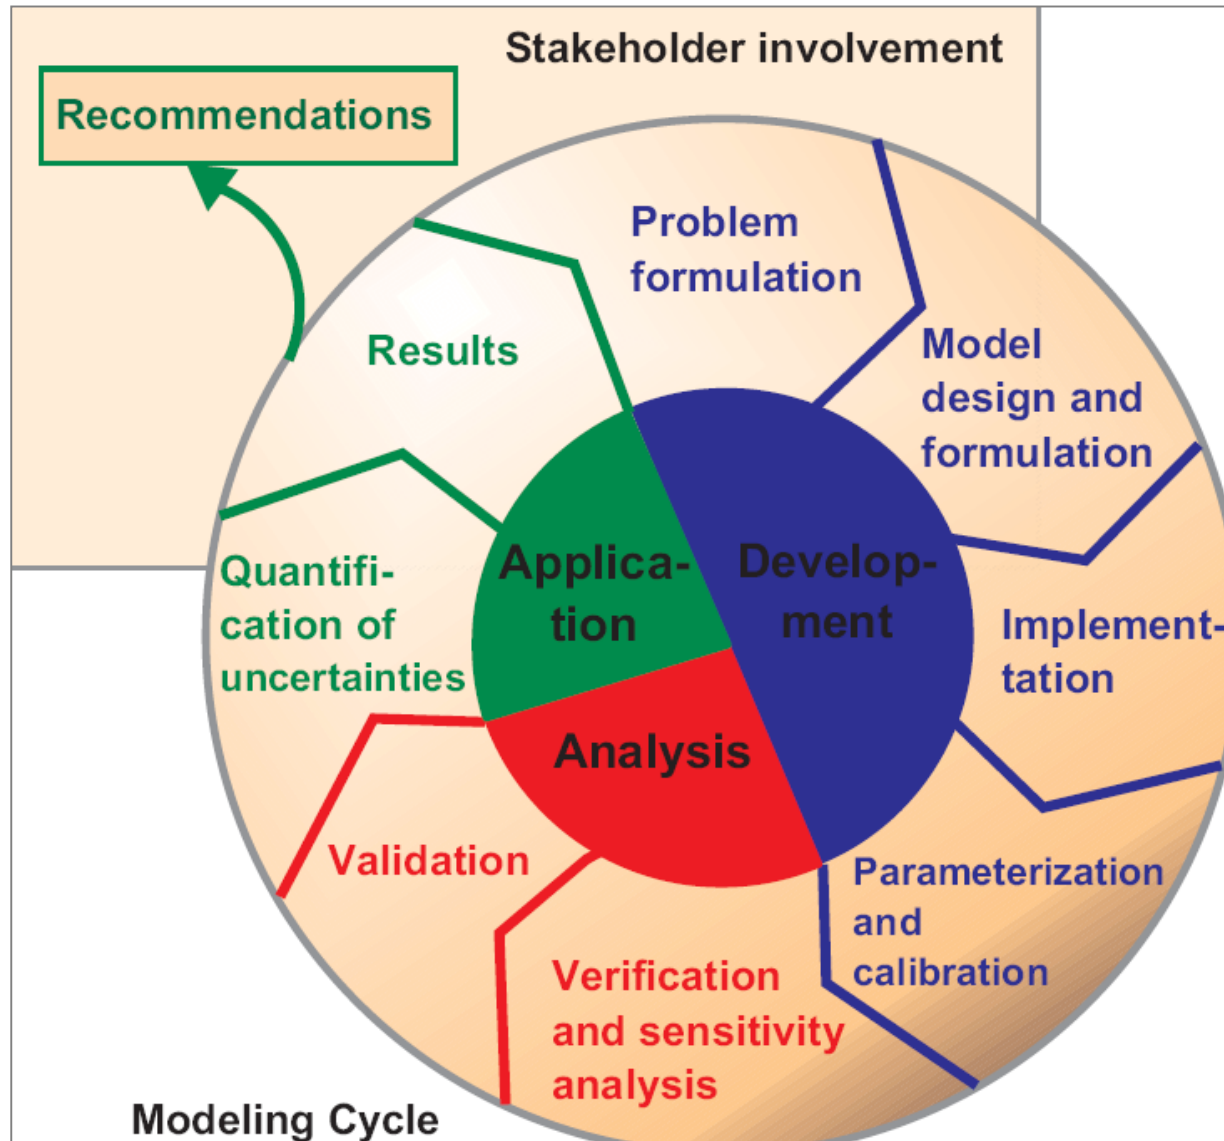

**Instead of:**

Do the right thing!

**Document** the right thing!

Establish a **standard** for documenting models, their development, and their analysis

# BASIS OF STANDARD: THE MODELLING CYCLE

## Box 1. TRACE (transparent and comprehensive ecological modeling) documentation structure

---

### I. Model development

**Problem formulation:** *Context* in which the model will be used, and the type of audience addressed; *specification of the question(s)* that should be answered with the model; statement of the *domain of applicability* of the model, including the extent of acceptable extrapolations; assessment of the *availability of knowledge and data*; specification of necessary *model outputs*.

**Design and formulation:** Description of the *conceptual model*; description and justification of the *modeling approach* used and of the *complexity, entities and processes represented* in the model; most important, the applied *assumptions* about the system.

**Model description:** Detailed *description of the actual model* and how it has been *implemented* (programs, software platforms, scripts).

**Parameterization:** *List of all parameter values* used in the model, the *data sources*, and how the parameter values were obtained or calculated; *uncertainties* associated with each parameter.

**Calibration:** Documentation of the *data sets used* for calibration; *which parameters* were calibrated; what *optimization method* was used.

### II. Model testing and analysis

**Verification:** Assessment of whether the model is working according to its specifications; documentation of what tests have been conducted.

**Sensitivity analysis:** Exploration of the model behavior for *varying parameters*; documentation of which *parameter combinations* have

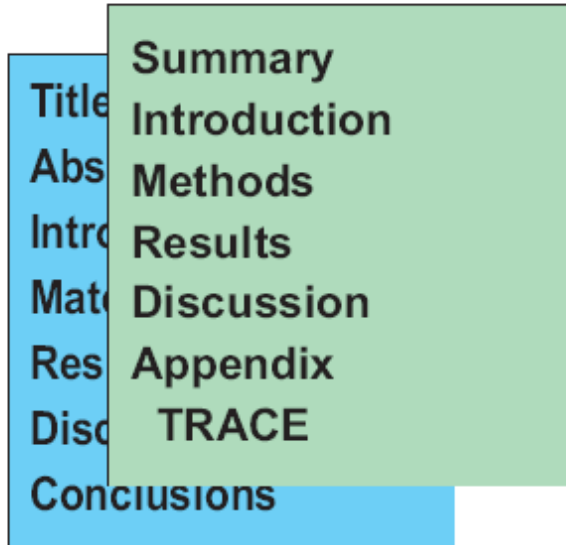

## Modeling Cycles

## Modeling Notebook

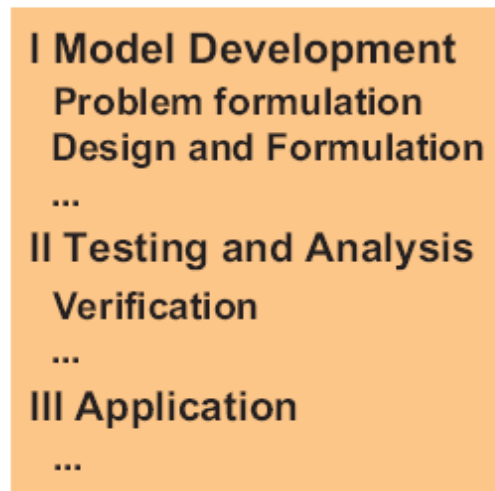

## Report or Dossier

## Scientific article

## TRACE Documentation

# OK – LET US TEST THIS IDEA

- Special Issue in "Ecological Modelling": about 10 TRACE documents produced
- TRACE II article (under construction) based on lessons learned in CREAM and elsewhere

<http://laikaspoetnik.files.wordpress.com/2010/05/30-5-2010-1-18-46-guinea-pigs-love-science.png>

## TRACE: FREQUENTLY ASKED QUESTIONS

- Unclear what exactly should be included in TRACE documents
- Level of detail and style of presentation very diverse
- Relation between ODD, TRACE, Modelling Notebook unclear
- Overlap of ODD and TRACE
- Overlap of TRACE categories (parameterization, calibration, sensitivity analysis)
- TRACE only for new models?
- Who is going to read 100 pages or more?
- TRACE is technical, for modellers only (Wang and Luttik 2012)

## UPDATE PAPER (under construction)

# **Towards better modelling and decision support: documenting model development, testing, and analysis using TRACE**

Running head: TRACE

Volker Grimm\*<sup>1,2</sup>, Andreas Focks, Béatrice Frank, Faten Gabsi,  
Alice S. A. Johnston<sup>3</sup>, Katarzyna Kulakowska, Chun Liu, Benjamin T. Martin,  
Mattia Meli, Viktoriia Radchuk, Amelie Schmolke, Pernille Thorbek,  
Steven F. Railsback

# TRACE: FREQUENTLY ASKED QUESTIONS

- Unclear what exactly should be included in TRACE documents
- Level of detail and style of presentation very diverse
- Relation between ODD, TRACE, Modelling Notebook unclear
- Overlap of ODD and TRACE
- Overlap of TRACE categories (parameterization, calibration, sensitivity analysis)
- TRACE only for new models?
- Who is going to read 100 pages or more?
- TRACE is technical, for modellers only (Wang and Luttk 2012)
- Information that significantly adds to the credibility of your model
- More specific guidance and templates are needed
- Oh, come on!
- Ja ja. Easy to fix.
- Will be fixed.
- Of course not, Chris!
- Supplement. Hierarchical structure/reading
- Misunderstanding. Biological background IS part of TRACE!

## STILL SOMETHING FUNDAMENTALLY WRONG

TRACE provides

- a standardized structure and terminology for documentation
- a checklist for modellers and decision makers

So far, so good, but:

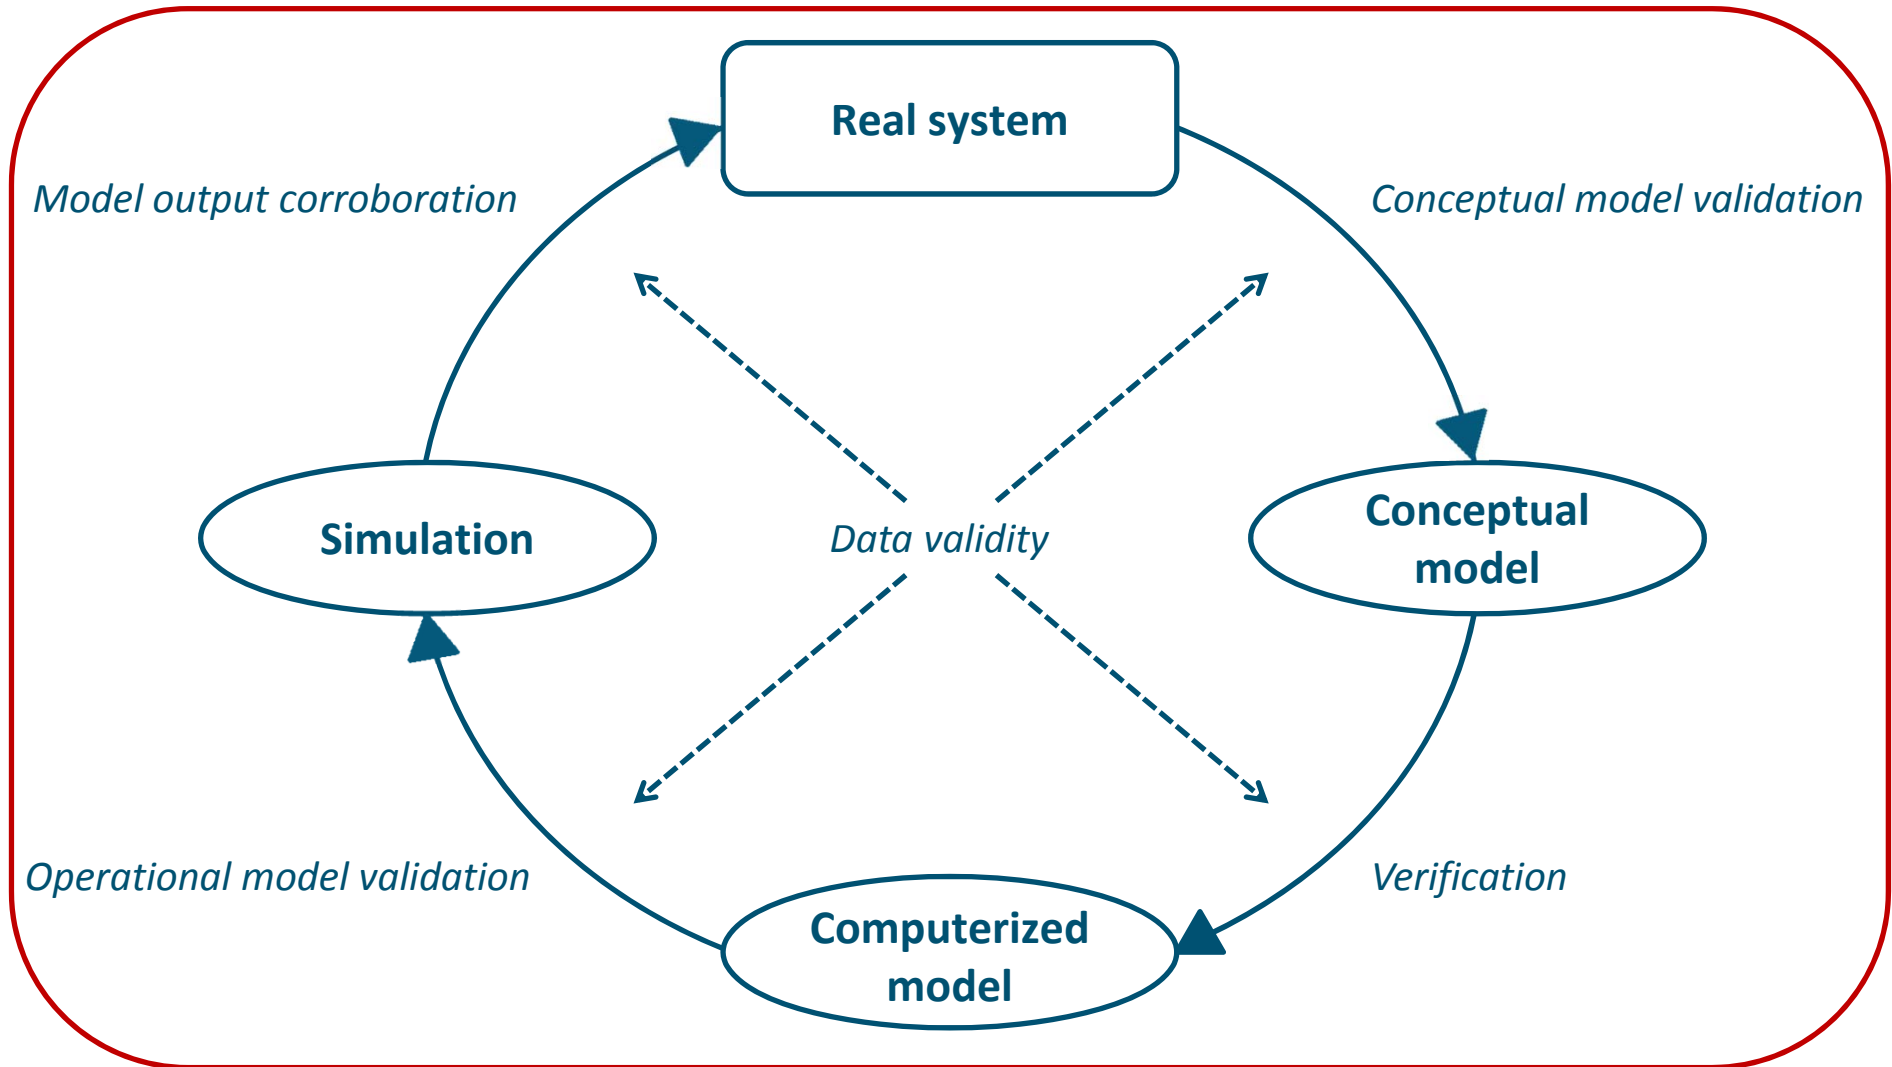

**HOW BORING IS THAT, documentation?**

**TRACE needs to be much clearer linked to a purpose or process!**

- This would make writing and reading TRACE documents much easier and more useful

# TRACE AND EVALUATION: CLOSELY RELATED

## Model evaluation

# LINKING TRACE AND EVALUATION

## EVALUATION:

‘The entire **process** of establishing model quality and credibility throughout all stages of model development and application’ (Augusiak et al., in prep.)

## TRACE:

- A standard format for organizing and documenting the five elements of model evaluation
- A means to an end: documenting to what degree and how good modelling practice was followed

**But: There is still Valery's question**

## VALERY'S QUESTION

**"But .. when IS a model good enough to base a decision on it?"**

TRACE and Evaluation do not answer this question, but:

- For each step of model evaluation/the TRACE document, we can **assemble criteria and approaches**, from **simple and not too powerful** to **complex but convincing**
- "Good enough" should then be **related to the purpose** of the model (e.g., screening, scenario assessment, quantitative predictions)

# IS THE MODEL GOOD ENOUGH: FILL IN THE SCORE SHEET

**Annotations:**

- Runs and wickets at the end of each over.
- Batsmen's names in batting order.
- Runs scored by each batsman.
- Record the method of batsman's dismissal.
- Record of progressive team's total.
- Symbol used to indicate a batsman is out.
- Record of bowler responsible for the batsman's dismissal.
- When a wicket falls record -
  1. Team's total
  2. Name of batsman out
  3. Not out batsman and his score
- Total runs scored by each batsman.
- Record all extras scored.
- Total of each type of extra at the end of the innings.
- Total score at end of the innings.
- For the 51st and subsequent overs in Test Cricket either continue on next page or record on a separate sheet of paper.
- Record of each unsuccessful review.
- Total of runs scored off each bowler at the end of the innings.
- Total of wickets taken by each bowler at the end of the innings.
- List of bowler's names to be used by the bowling team.
- How to score a complete over.
- Progressive total of runs scored off a bowler.
- Record of events of an individual over.
- Total of overs and maidens bowled off each bowler at the end of the innings.
- Wides and no balls recorded against each bowler progressively.

**Score Sheet Data:**

OVERS	BATSMAN	Runs	Wickets	Method
1	Hayden	11	0	
2	Boycott	1	0	
3	Gower	1	0	
4	Bradman	2	0	
5	Sobers	0	1	GOLDEN DUCK
6	Richards	0	0	
7	Gilchrist	0	0	
8	Hadlee	0	0	
9	Flintoff	0	0	
10	Warne	0	0	
11	Lille	0	0	

BOWLER	OVERS	MAIDENS	RUNS	WICKETS	REVIEW
McGrath	5	1	1	1	22
Garner	4	1	0	0	11
Trueman	1	0	0	0	12
Imran	4	1	2	1	17
Dev	1	0	1	1	4
Underwood					
Kallis					
Gibbs					

**Summary:** Total Score: 474

# EXAMPLE

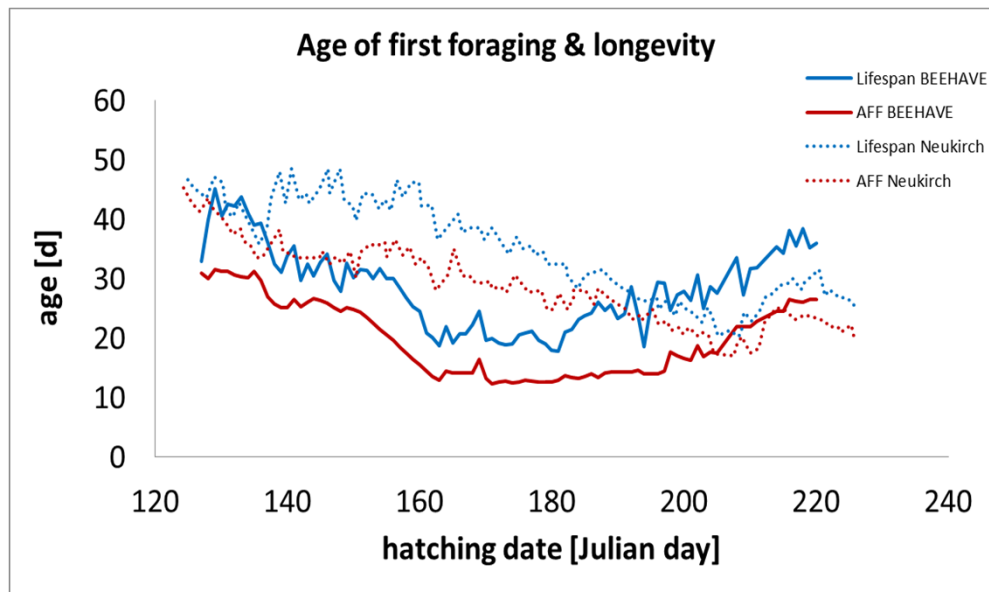

**Table 1.** Comparison of experimental data and model results for average age of onset of foraging (AAOF) and lifespan.

Colony	Flightspan (days)	Deathrate, $m$ (days <sup>-1</sup> )	AAOF		Lifespan	
			Observed	Model	Observed	Model
1 (Large)	7.5	0.133	18.6	19.4	22.8	26.9
2 (Large)	6.5	0.154	18.4	17.7	22.3	24.2
3 (Small)	6.7	0.149	23.8	17.6	26.6	24.3
4 (Small)	8.8	0.114	22.2	20.4	26.4	29.2

Experimental data is from Rueppell et al [33] and model results were obtained by running the model for 40 days (approximately the observational period used by Rueppell et al). At the start of each model run  $H=9000$  for large colonies and 4500 for small colonies and  $F=0$ . The parameters were  $L=2000$ ,  $w=27000$ ,  $\alpha=0.25$  and  $\sigma=0.75$ .

doi:10.1371/journal.pone.0018491.t001

Khoury et al. 2011. PLoS ONE 6(4): e18491.

BEEHAVE, Becher et al., in prep.

How much does this information add to the credibility of the models?

# SUMMARY

- **How can decision makers assess and use models?**
- **Idea of TRACE still good, but**
- **Update needed**
- **Link TRACE and Evaluation**
- **On the basis of this, define assessment criteria ("score sheet")**
